

Task 1. Learn Composing with Components

I further learnt more about Vue.js framework and its different components in depth as well as the principles of web design. I also learnt about advanced components, such as routing, which enabled me to route from one Vue component to the other with ease. I also spent extra time on this week learning the component system in Vue. The component system is an abstract level understanding of the web application we intend to build. The component system allows us to map out all small, self-contained components of an application (no matter how large or small the scale of the app is) into a tree of components, illustrated as below.

For the first task, I made a tree of component for my website, “Kuritsuku”. Later on, I will implement all components listed. So far, I’ve made `home.vue`, `footer.vue`, `nav.vue`, `login.vue` and `about.vue`.
